1 Conceptual & Logical Design

1.1 Functional Requirements

These specify what the system must do, focusing on the capabilities required for the inventory and order management system.

User Management

- **Create/Update/Delete Users:** Administrators can manage user accounts stored in the `users` table, which includes fields such as `username`, `email`, `password_hash`, `role_name` (`admin` or `staff`), and `warehouse_id`.
- **Authentication:** Users must log in using their email and password. Login attempts are recorded in the `login_logs` table, including `ip_address`, `user_agent`, and `refresh_token`.
- **Role-Based Access:** Admins have full access. Staff users are limited to managing products and orders within their assigned `warehouse_id`.

Example: An admin creates a user with `role_name = 'staff'` and assigns them to `warehouse_id = 1`. The system logs their login on 2025-05-20 22:17:00 from IP 192.168.1.1.

Warehouse Management

- **Manage Warehouses:** Warehouses are stored and updated in the `warehouses` table with fields like `name` and `address`.
- **Associate Entities:** Warehouses are linked to both users and products via `warehouse_id`.

Example: A warehouse named “Central Hub” at “123 Main St” is linked to multiple products and users.

Supplier Management

- **Manage Suppliers:** Supplier data is stored in the `suppliers` table, including `name`, `contact_name`, `contact_email`, and `phone`.
- **Link to Products:** Each product is linked to a supplier via `supplier_id`.

Example: A supplier “TechCorp” with email “contact@techcorp.com” supplies products like “Laptop” and “Mouse”.

Category Management

- **Manage Categories:** Categories are stored in the `categories` table with fields `name` and `description`.
- **Link to Products:** Products reference a `category_id` to indicate category.

Example: A category “Electronics” with description “Gadgets and devices” includes products like “Smartphone”.

Product Management

- **Manage Products:** Products are stored in the `products` table with fields `name`, `description`, `price`, `quantity`, and `image_url`, linked to `suppliers`, `warehouses`, and `categories`.
- **Inventory Tracking:** The system tracks quantity per warehouse and updates it when orders are placed.

Example: A product “Laptop” with price 999.99 and quantity 50 is stored in warehouse “Central Hub” and belongs to the “Electronics” category.

Customer Management

- **Manage Customers:** Customers are stored in the `customers` table with fields such as `name`, `email`, `phone`, and `address`.

Example: Customer “John Doe” with email “john@example.com” has placed multiple orders.

Order Management

- **Create/Track Orders:** Orders are stored in the `orders` table, including `customer_id`, `order_date`, and `status` (pending, completed, cancelled).
- **Link to Order Items:** Orders are connected to `order_items`, which link to products through `product_order_items`.
Example: Order with `order_id = 1` for customer “John Doe” on 2025-05-20 includes two laptops (quantity = 2, `total_price = 1999.98`).

Order Item Tracking

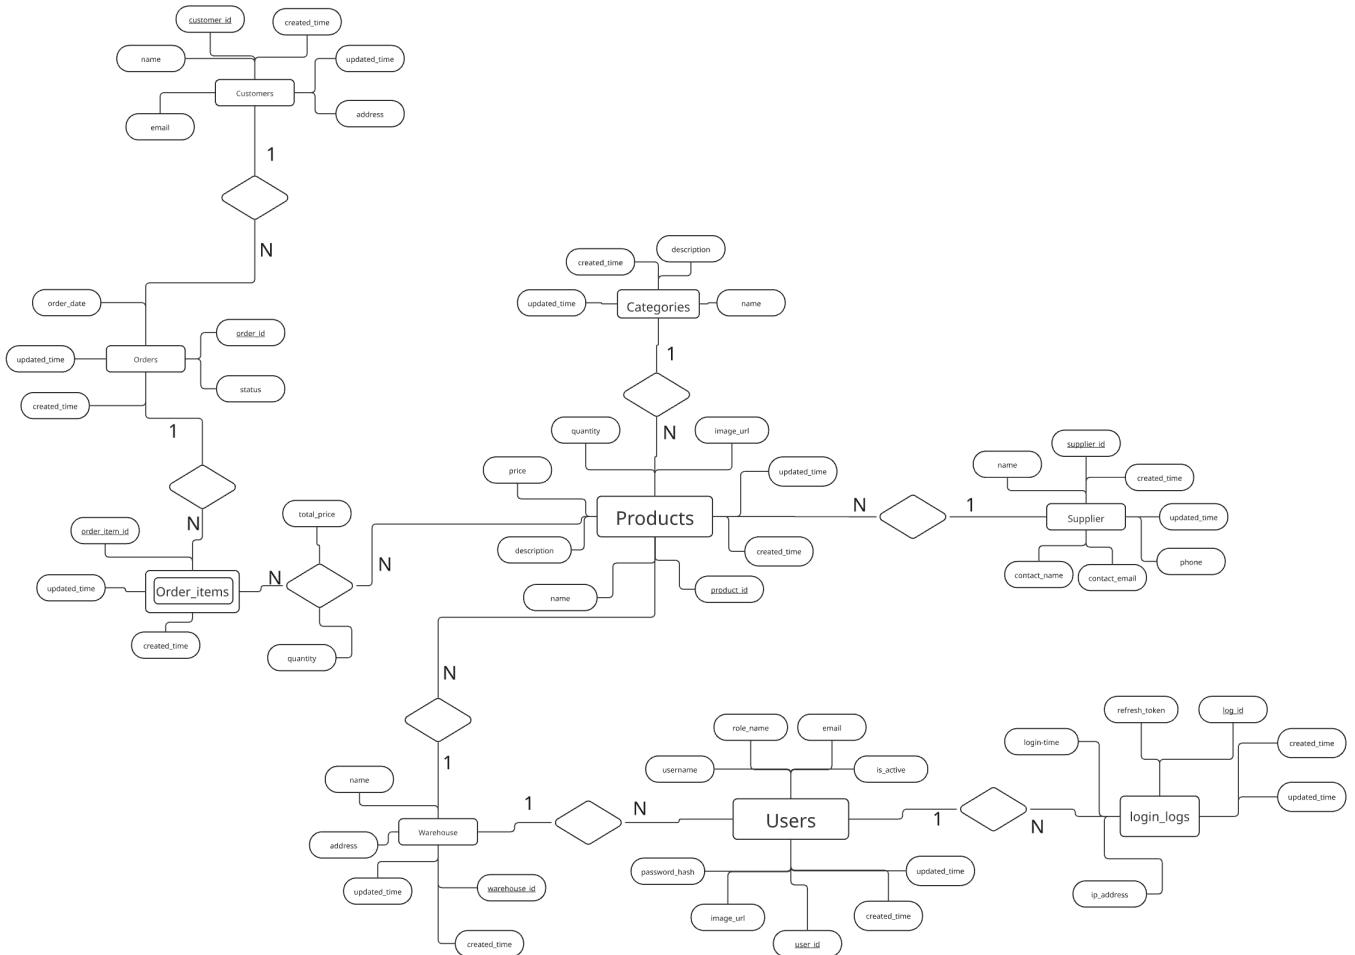

- **Manage Order Items:** Order items are tracked in the `order_items` table and linked to products via `product_order_items` including `quantity` and `total_price`.
Example: `order_item_id = 1` links to `product_id = 1` (Laptop) with quantity = 2.

1.2 Non-Functional Requirements

These define system qualities like performance, security, and maintainability.

- **Performance:** Queries (e.g., product searches, order lookups) should return results in under 2 seconds for up to 50 concurrent users.
Example: A product search by category uses an index on `products.category_id` for fast retrieval.
- **Scalability:** The system must support a modest scale of up to a few thousand products and hundreds of orders without significant performance degradation.
Example: Partitioning orders by `order_date` ensures efficient access.
- **Security:** Passwords must be hashed (e.g., bcrypt). All login attempts must be logged in `login_logs` to detect suspicious access.
Example: A failed login attempt for `user_id = 1` is recorded with the `ip_address` and `user_agent`.
- **Reliability:** Foreign key constraints (e.g., `fk_products_supplier`) ensure data integrity. Order updates must be atomic and isolated to prevent race conditions.
Example: Updating `products.quantity` during an order is handled in a transaction.
- **Availability:** The system should maintain 99.5% uptime. A simple master-slave database setup ensures basic failover support.
Example: A replicated MySQL setup improves resilience during maintenance.
- **Maintainability:** The schema must be fully normalized (to at least 3NF) to reduce redundancy and simplify modifications.
Example: Adding a new attribute to a product only requires a column addition in the `products` table.
- **Architecture and Technologies:**
 - Fully normalized schema (3NF)
 - Fast API responses with caching (e.g., Redis)
 - Secure authentication using JWT and bcrypt-hashed passwords
 - ACID-compliant database transactions
 - Indexed queries for optimized performance
 - Modular, containerized architecture using Docker
 - Responsive and intuitive UI (e.g., built with Next.js)
 - CI/CD-enabled development workflow

1.3 Entity–Relationship Diagram

- Warehouses have a one-to-many relationship with:
 - Users
 - Products
- Suppliers have a one-to-many relationship with Products.
- Categories have a one-to-many relationship with Products.
- Customers place multiple Orders (one-to-many).
- Orders contain multiple Order_Items (one-to-many).
- Products and Order_Items have a many-to-many relationship through the Product_Order_Items junction table.

1.4 Normalization proof up to Third Normal Form (3NF)

This section provides a detailed normalization proof for the database schema, demonstrating that all tables conform to the rules of First Normal Form (1NF), Second Normal Form (2NF), and Third Normal Form (3NF).

First Normal Form (1NF)

Requirement: All attributes must be atomic (no multi-valued attributes or repeating groups), and each table must have a primary key.

Analysis:

- **Atomic Attributes:** Every attribute in all tables contains only atomic values. For instance:

- `users.email` stores one unique email address per user.
- `products.price` stores a single decimal value.
- `customers.address` uses a `TEXT` field but holds a single address per customer, not multiple.
- `products.quantity` is an integer that represents a single count value.

- **Primary Keys:**

- **Single-column primary keys:** `warehouses(warehouse_id)`, `users(user_id)`, `products(product_id)`, `suppliers(supplier_id)`, `categories(category_id)`, `orders(order_id)`, `order_items(order_item_id)`, etc.
- **Composite primary key:** `product_order_items(product_id, order_item_id)` uses a composite key to identify the relationship between a product and an order item.

Conclusion: All tables have primary keys and atomic attributes. Therefore, the schema satisfies 1NF.

Second Normal Form (2NF)

Requirement: The schema must first satisfy 1NF, and all non-key attributes must depend on the entire primary key (i.e., no partial dependencies).

Analysis:

- **Tables with single-column primary keys:**

- Examples include `users`, `products`, `orders`, etc.
- All non-key attributes in these tables are fully functionally dependent on the primary key. For instance:
 - * In `users`, attributes like `email`, `role_name`, and `is_active` depend entirely on `user_id`.
 - * In `products`, attributes such as `name`, `price`, `quantity`, etc., depend entirely on `product_id`.

- **Table with composite key:**

- `product_order_items(product_id, order_item_id)` uses a composite key.
- Attributes `quantity` and `total_price` depend on the entire composite key.
- Example: `quantity = 2` only makes sense when referring to a specific combination of `product_id` and `order_item_id`, not just one of them.

Conclusion: There are no partial dependencies; every non-key attribute depends on the full key. Thus, all tables are in 2NF.

Third Normal Form (3NF)

Requirement: The schema must satisfy 2NF and have no transitive dependencies. That is, no non-key attribute should depend on another non-key attribute.

Analysis:

- **users:** All non-key attributes (e.g., `username`, `email`, `is_active`) depend directly on the primary key `user_id`. Although `warehouse_id` is a foreign key, it does not introduce transitive dependency (e.g., `email` does not depend on `warehouse_id`).
- **products:** Attributes such as `name`, `price`, and `quantity` depend only on `product_id`. Foreign keys like `supplier_id` and `category_id` do not cause transitive dependencies. For example, `price` does not depend on `supplier_id`.
- **orders:** Attributes `order_date` and `status` depend on `order_id`, not on `customer_id`. There is no chaining of dependencies among non-key attributes.
- **Avoidance of transitive storage:** If, for instance, `supplier_name` were stored directly in the `products` table, it would be transitively dependent via `supplier_id`. However, the schema correctly avoids this by referencing the name through a foreign key.

Conclusion: No transitive dependencies exist in any table. Therefore, the schema satisfies 3NF.

Final Remark: Since the schema adheres to 1NF, 2NF, and 3NF, it is properly normalized up to **Third Normal Form (3NF)**.

2 Implement Database Entities

2.1 Database Schema

The complete database schema including table definitions, constraints, and relationships can be found in the following GitHub repository:

- <https://github.com/truongng201/Database-IMS-Project/tree/main/ims-database/init-scripts>

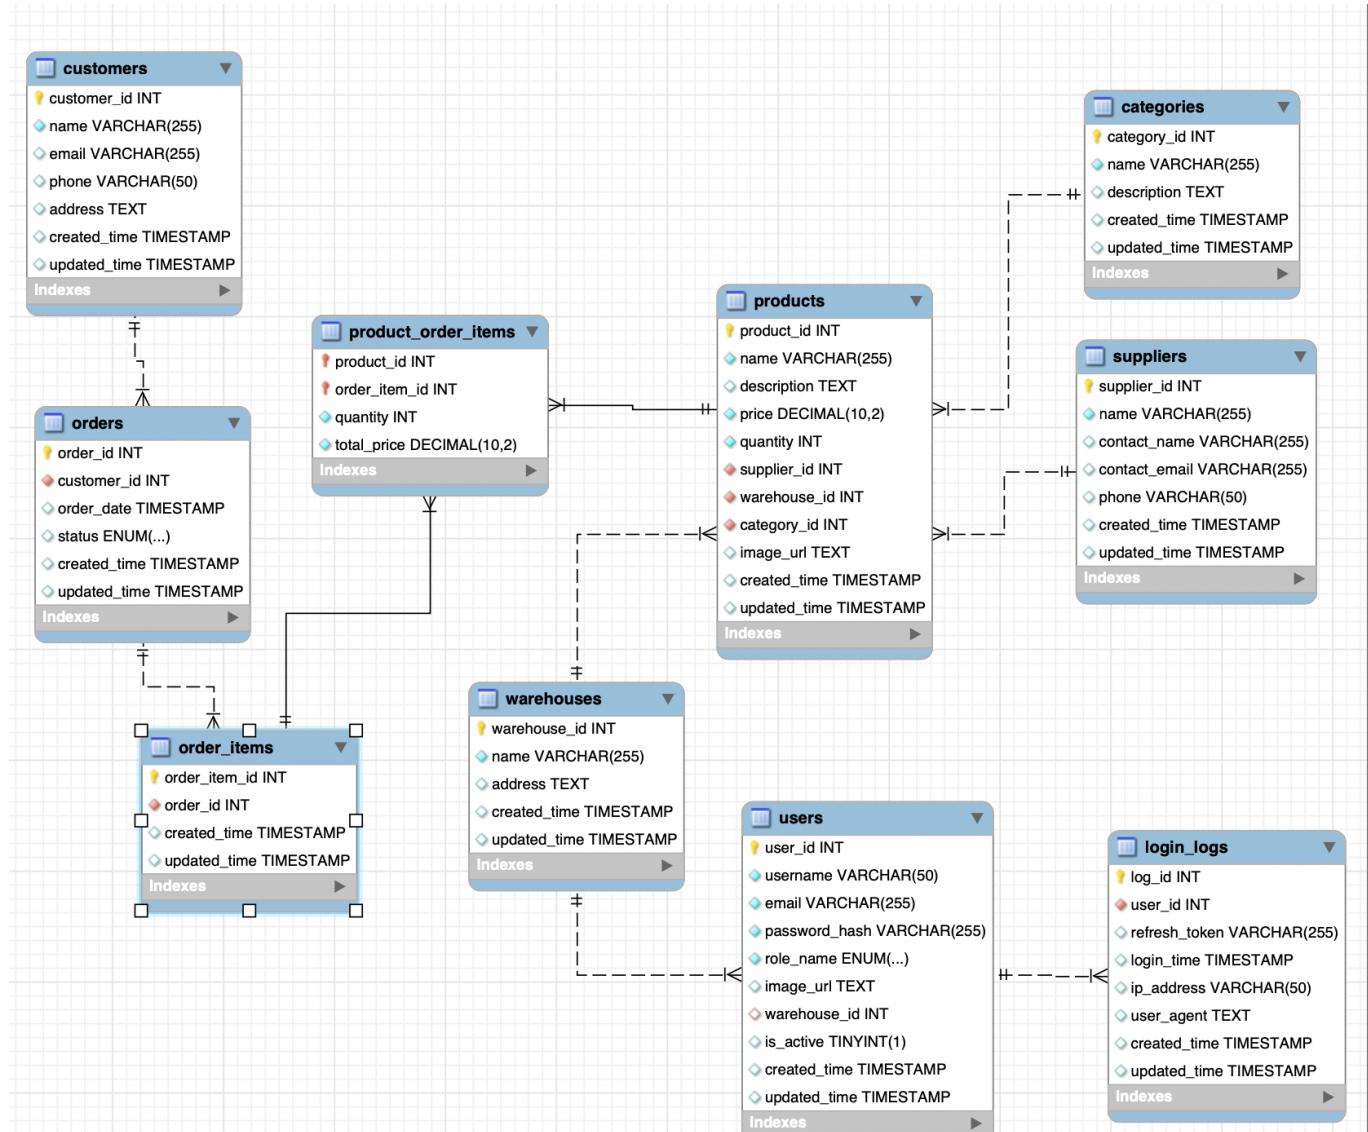

Figure 1: Database Schema Diagram

2.2 Views

The system defines eight views to enhance readability, simplify complex queries, and support user-friendly data summaries for the admin dashboard and analytics.

1. supplier_products_view

- Joins warehouses, suppliers, products, and categories.
- Provides detailed information about each supplier and the products they provide to each warehouse.

```

1 CREATE OR REPLACE VIEW supplier_products_view AS
2 SELECT
3     w.warehouse_id,
4     w.name AS warehouse_name,
5     s.supplier_id,
6     s.name AS supplier_name,
7     s.contact_name,
8     s.contact_email,
9     s.phone AS contact_phone,
10    p.product_id,
11    p.name AS product_name,
12    p.description,
13    p.price,
14    p.quantity,
15    c.category_id,
16    c.name AS category_name,
17    p.created_time AS product_created_time,
18    p.updated_time AS product_updated_time
19 FROM
20     suppliers s
21     LEFT JOIN products p ON s.supplier_id = p.supplier_id
22     LEFT JOIN warehouses w ON p.warehouse_id = w.warehouse_id
23     LEFT JOIN categories c ON p.category_id = c.category_id;

```

2. all_suppliers_by_warehouse_view

- Groups suppliers by warehouse and summarizes total products, quantity, and average price.
- Useful for warehouse-wise supplier insights.

```

1 CREATE OR REPLACE VIEW all_suppliers_by_warehouse_view AS
2 SELECT
3     w.warehouse_id,
4     w.name AS warehouse_name,
5     s.supplier_id,
6     s.name AS supplier_name,
7     s.contact_name,
8     s.contact_email,
9     s.phone,
10    COALESCE(COUNT(p.product_id), 0) AS total_products,
11    COALESCE(SUM(p.quantity), 0) AS total_product_quantity,
12    COALESCE(AVG(p.price), 0) AS avg_product_price,
13    MIN(p.created_time) AS earliest_product_created,
14    MAX(p.updated_time) AS latest_product_updated,
15    s.created_time AS supplier_created_time,
16    s.updated_time AS supplier_updated_time
17 FROM
18     suppliers s
19     LEFT JOIN products p ON s.supplier_id = p.supplier_id
20     LEFT JOIN warehouses w ON p.warehouse_id = w.warehouse_id
21 GROUP BY
22     w.warehouse_id,
23     w.name,
24     s.supplier_id,
25     s.name,
26     s.contact_name,
27     s.contact_email,
28     s.phone,
29     s.created_time,
30     s.updated_time;

```

3. customer_summary_view

- Summarizes each customer's order history, total spending, and most recent purchase.
- Enables quick access to customer value and activity.

```

1 CREATE OR REPLACE VIEW customer_summary_view AS
2 SELECT
3     c.customer_id AS customer_id,
4     c.name AS name,
5     c.email AS email,
6     c.phone AS phone,
7     c.address AS address,
8     c.updated_time AS customer_updated_time,
9     COUNT(DISTINCT CASE WHEN poi.product_id IS NOT NULL THEN o.order_id END) AS
10    total_number_orders,
11    COALESCE(SUM(poi.total_price), 0) AS total_spent,
12    MAX(CASE WHEN poi.product_id IS NOT NULL THEN o.order_date END) AS last_purchase
13 FROM
14     customers c
15     LEFT JOIN orders o ON c.customer_id = o.customer_id
16     LEFT JOIN order_items oi ON o.order_id = oi.order_id
17     LEFT JOIN product_order_items poi ON oi.order_item_id = poi.order_item_id
18 GROUP BY
19     c.customer_id, c.name, c.email, c.phone, c.updated_time;

```

4. order_summary_view

- Summarizes orders including total items, value, and unique products.
- Facilitates administrative monitoring of order trends.

```

1 CREATE OR REPLACE VIEW order_summary_view AS
2 SELECT
3     o.order_id,
4     o.order_date,
5     o.status,
6     c.customer_id,
7     c.name AS customer_name,
8     c.email AS customer_email,
9     c.phone AS customer_phone,
10    p.warehouse_id,
11    w.name AS warehouse_name,
12    SUM(poi.quantity) AS total_items,
13    SUM(poi.total_price) AS total_order_value,
14    COUNT(DISTINCT poi.product_id) AS unique_products_ordered
15 FROM
16     orders o
17     LEFT JOIN customers c ON o.customer_id = c.customer_id
18     LEFT JOIN order_items oi ON o.order_id = oi.order_id
19     LEFT JOIN product_order_items poi ON oi.order_item_id = poi.order_item_id
20     LEFT JOIN products p ON poi.product_id = p.product_id
21     LEFT JOIN warehouses w ON p.warehouse_id = w.warehouse_id
22 WHERE
23     p.product_id IS NOT NULL
24 GROUP BY
25     o.order_id,
26     o.order_date,
27     o.status,
28     c.customer_id,
29     c.name,

```

```

30     c.email,
31     c.phone,
32     p.warehouse_id,
33     w.name;

```

5. order_detail_summary

- Provides complete order details including customer, product, quantity, and timestamps.
- Supports customer service and operational analytics.

```

1 CREATE OR REPLACE VIEW order_detail_summary AS
2 SELECT
3     o.order_id,
4     o.order_date,
5     o.status AS order_status,
6
7     c.customer_id,
8     c.name AS customer_name,
9     c.email AS customer_email,
10    c.phone AS customer_phone,
11
12    oi.order_item_id,
13
14    p.product_id,
15    p.name AS product_name,
16    p.price AS product_price,
17    poi.quantity AS quantity_ordered,
18    poi.total_price AS total_price,
19
20    w.warehouse_id,
21    w.name AS warehouse_name,
22
23    o.created_time AS order_created_time,
24    o.updated_time AS order_updated_time
25 FROM
26     orders o
27     JOIN customers c ON o.customer_id = c.customer_id
28     JOIN order_items oi ON o.order_id = oi.order_id
29     JOIN product_order_items poi ON oi.order_item_id = poi.order_item_id
30     JOIN products p ON poi.product_id = p.product_id
31     JOIN warehouses w ON p.warehouse_id = w.warehouse_id;

```

6. product_summary

- Lists all products along with category, supplier, and warehouse details.
- Useful for both staff and admin product listings and searches.

```

1 CREATE OR REPLACE VIEW product_summary AS
2 SELECT
3     p.product_id,
4     p.name,
5     p.description,
6     p.price,
7     p.image_url,
8     p.quantity,
9     c.category_id AS category_id,
10    c.name AS category_name,
11    s.supplier_id AS supplier_id,

```

```

12     s.name AS supplier_name ,
13     w.warehouse_id AS warehouse_id ,
14     w.name AS warehouse_name
15 FROM products p
16 JOIN categories c ON p.category_id = c.category_id
17 JOIN suppliers s ON p.supplier_id = s.supplier_id
18 JOIN warehouses w ON p.warehouse_id = w.warehouse_id
19 ORDER BY p.updated_time DESC, product_id ASC;

```

7. user_activity

- Tracks login logs by user with details on IP address, user agent, and warehouse.
- Helps with user monitoring and security audits.

```

1 CREATE OR REPLACE VIEW user_activity AS
2 SELECT
3     u.user_id ,
4     u.username ,
5     u.email ,
6     u.role_name ,
7     w.name AS warehouse_name ,
8     ll.login_time ,
9     ll.ip_address ,
10    ll.user_agent
11 FROM users u
12 LEFT JOIN login_logs ll ON u.user_id = ll.user_id
13 LEFT JOIN warehouses w ON u.warehouse_id = w.warehouse_id;

```

8. low_stock_alert

- Flags products with quantity below threshold (10).
- Used to trigger restocking actions.

```

1 CREATE OR REPLACE VIEW low_stock_alert AS
2 SELECT
3     p.product_id ,
4     p.name AS product_name ,
5     p.quantity ,
6     w.name AS warehouse_name ,
7     s.name AS supplier_name
8 FROM products p
9 JOIN warehouses w ON p.warehouse_id = w.warehouse_id
10 JOIN suppliers s ON p.supplier_id = s.supplier_id
11 WHERE p.quantity < 10;

```

2.3 Stored Procedures

For our project, we only use 2 procedure only

2.3.1 CreateOrder

Purpose: This procedure creates a new order for a customer, inserts the associated order item, and links multiple products with their quantities and total prices to the order item.

DELIMITER //

```
CREATE PROCEDURE CreateOrder(
```

```

        IN p_customer_id INT,
        IN p_product_ids TEXT,
        IN p_quantities TEXT,
        IN p_prices TEXT
    )
BEGIN
    DECLARE order_id INT;
    DECLARE order_item_id INT;

    INSERT INTO orders (customer_id) VALUES (p_customer_id);
    SET order_id = LAST_INSERT_ID();

    INSERT INTO order_items (order_id) VALUES (order_id);
    SET order_item_id = LAST_INSERT_ID();

    WHILE LOCATE(',,', p_product_ids) > 0 DO
        INSERT INTO product_order_items (product_id, order_item_id, quantity, total_price)
        VALUES (
            CAST(SUBSTRING_INDEX(p_product_ids, ',,', 1) AS UNSIGNED),
            order_item_id,
            CAST(SUBSTRING_INDEX(p_quantities, ',,', 1) AS UNSIGNED),
            CAST(SUBSTRING_INDEX(p_prices, ',,', 1) AS DECIMAL(10, 2))
        );

        SET p_product_ids = SUBSTRING(p_product_ids FROM LOCATE(',,', p_product_ids) + 1);
        SET p_quantities = SUBSTRING(p_quantities FROM LOCATE(',,', p_quantities) + 1);
        SET p_prices = SUBSTRING(p_prices FROM LOCATE(',,', p_prices) + 1);
    END WHILE;

    INSERT INTO product_order_items (product_id, order_item_id, quantity, total_price)
    VALUES (
        CAST(p_product_ids AS UNSIGNED),
        order_item_id,
        CAST(p_quantities AS UNSIGNED),
        CAST(p_prices AS DECIMAL(10, 2))
    );
END //
DELIMITER ;

```

2.3.2 UpdateProductQuantity

Purpose: This procedure updates the quantity of a product in stock after an order has been placed or modified.

DELIMITER //

```

CREATE PROCEDURE UpdateProductQuantity(
    IN p_product_id INT,
    IN p_quantity_change INT
)
BEGIN
    UPDATE products
    SET quantity = quantity - p_quantity_change
    WHERE product_id = p_product_id;
END //
DELIMITER ;

```

2.4 Triggers

To ensure product quantity reflects real-time sales, we implement a trigger to auto-decrement inventory when an order is placed.

```
1 DELIMITER $$  
2  
3 CREATE TRIGGER trg_after_insert_product_order_items  
4 AFTER INSERT ON product_order_items  
5 FOR EACH ROW  
6 BEGIN  
7     UPDATE products  
8     SET quantity = quantity - NEW.quantity,  
9         updated_time = CURRENT_TIMESTAMP  
10    WHERE product_id = NEW.product_id;  
11 END$$  
12  
13 DELIMITER ;
```

- **Purpose:** Automatically updates product quantity after an item is ordered.
- **Scope:** Applies to all inserts into `product_order_items`.

3 Performance tuning

3.1 System Architecture

This system is designed using a microservices-based architecture with containerized deployment. It integrates a relational database, in-memory data store, object storage, and web frontend to deliver a complete inventory and order management solution.

Backend Services:

- Implemented with **FastAPI**, exposing RESTful APIs for core modules (Product, Order, User, etc.).
- Each service is deployed as a separate container and communicates via internal network.

Databases:

- **MySQL**: Stores normalized relational data with support for constraints, stored procedures, triggers, and views.
- **Redis**: Used for caching and pub/sub messaging to support real-time synchronization (e.g., between frontend dashboards).
- **MinIO**: S3-compatible object storage for hosting product images, invoices, and exported reports.

Frontend:

- Built with **Next.js**, a React framework for server-side rendering and API integration.
- Interacts with backend services through API endpoints.

Authentication and Validation:

- **JWT (JSON Web Tokens)** is used for stateless user authentication.
- **Pydantic** ensures request/response schema validation in FastAPI.

Deployment and DevOps:

- **Docker** and **Docker Compose** manage containerized services and networks.
- **Nginx Proxy Manager** acts as a reverse proxy to route public traffic to service endpoints.
- **Portainer** is used for visual container management.
- **GitHub Actions** handles CI/CD for building, testing, and deploying services automatically.

Setup and Usage:

1. Clone the project repository:

```
git clone git@github.com:truongng201/Database-IMS-Project.git
cd Database-IMS-Project
```

2. Configure environment variables using ‘.env’ (refer to ‘.template.env’ for structure).

3. Build and launch backend and frontend services:

```
make services-up SERVICE='product order' # Example: start product and order services
make client-dev # Launch frontend in development mode
```

4. Access the application locally:

- Frontend: <http://localhost:3000>
- API Services: http://localhost:8080/v1/{service_name}
- MinIO UI: <http://localhost:9001>

5. Access the application in production (DuckDNS setup):

- Frontend: <https://vinuni-database-ims.duckdns.org>
- API: https://api.vinuni-database-ims.duckdns.org/v1/{service_name}
- Documentation: <https://api.vinuni-database-ims.duckdns.org/v1/user/docs>
- MinIO: <https://minio.vinuni-database-ims.duckdns.org>

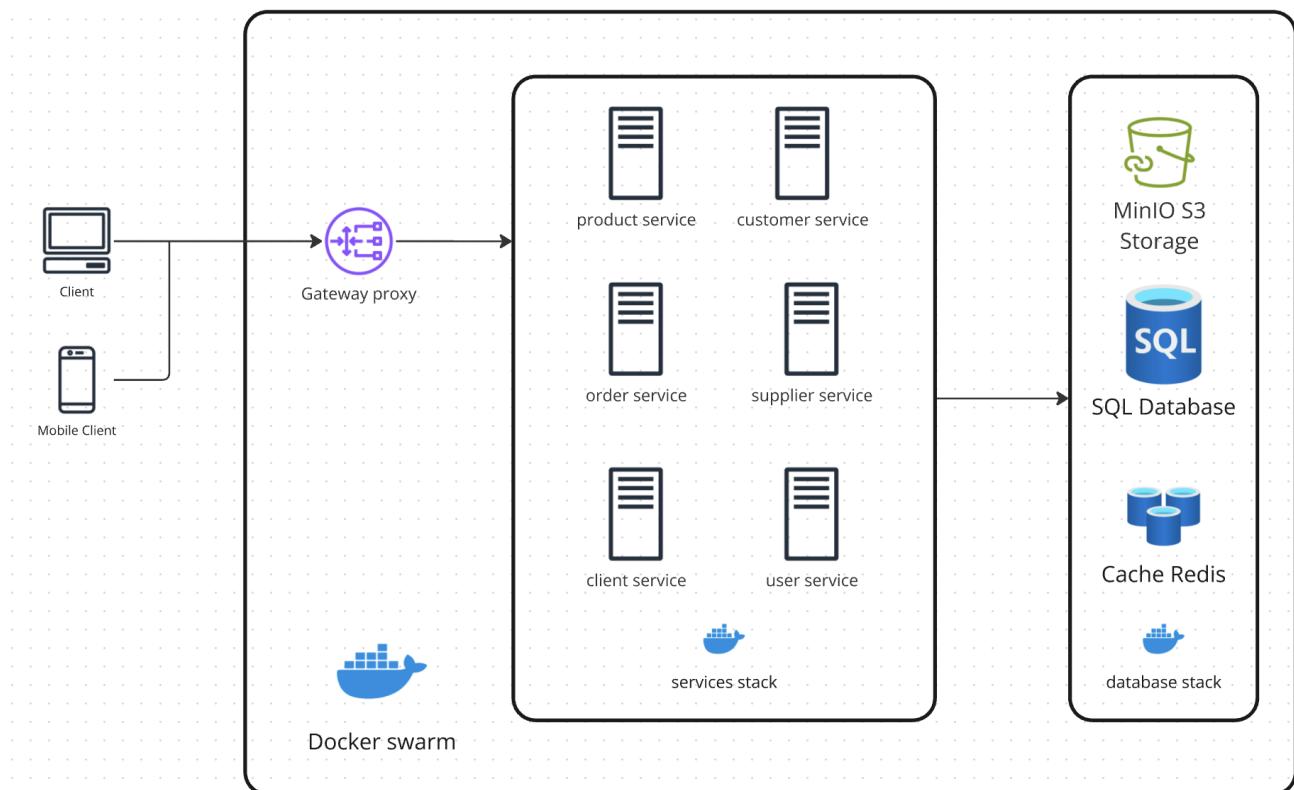

Figure 2: Overall system architecture

3.2 Indexing

3.2.1 Use of Indexing

Indexing involves creating special lookup structures (indexes) on one or more columns of a table. These indexes significantly improve data retrieval speed by allowing the database engine to locate rows more efficiently, rather than performing a full table scan. Indexes are particularly beneficial for columns that are frequently used in `WHERE` clauses, `JOIN` conditions, or `ORDER BY` clauses.

3.2.2 Query Optimization Evidence (Before vs. After)

One sample case: Optimizing customer Lookup by Email (`customers.email`)

- **Objective:** To improve the speed and efficiency of querying customer information based on their email address, a frequent operation for customer service, order processing, or marketing purposes.
- **Strategy:** An index named `idx_customers_email` was created on the `email` column of the `customers` table.
- **Analysis (Before):**

- The EXPLAIN output indicated a full table scan (`type: ALL`) due to the absence of a suitable index on the `email` column.
- A high `Handler_read_rnd_next` value (101) confirmed that rows were being read through physical scanning, which is inefficient especially for large datasets.

```

329 -- Bước 3: Chạy EXPLAIN để xem kế hoạch thực thi
330 • EXPLAIN SELECT customer_id, name FROM customers WHERE email = 'kaitlynsmith@example.net'; -- Thay email nếu cần
```
Result Grid | Filter Rows: Export: Wrap Cell Content:

ID	Select_Type	Table	Partitions	Type	Possible_Keys	Key	Key_Len	Ref	Rows	Filtered	Extra
1	SIMPLE	customers	HULL	ALL	HULL	HULL	NULL	NULL	100	10.00	Using where

```

```

Figure 3: EXPLAIN output before indexing

```

Result Grid | Filter Rows: Export: Wrap Cell Content: 

| Variable_name         | Value |
|-----------------------|-------|
| Handler_read_first    | 1     |
| Handler_read_key      | 1     |
| Handler_read_last     | 0     |
| Handler_read_next     | 0     |
| Handler_read_prev     | 0     |
| Handler_read_rnd      | 0     |
| Handler_read_rnd_next | 101   |

```

Figure 4: EXPLAIN output before indexing

• Analysis (After):

- A significant improvement was observed: EXPLAIN showed a switch to an efficient index lookup (`type: ref`) using `idx_customers_email`.
- Estimated rows scanned dropped from 100 to just 1.
- `Handler_read_rnd_next` dropped to 0, eliminating the full table scan.
- Increase in `Handler_read_key` (to 144) and `Handler_read_next` (to 117) was expected, reflecting indexed navigation.

```

352 -- Bước 7: Chạy EXPLAIN lại để xem kế hoạch thực thi đã thay đổi
353 • EXPLAIN SELECT customer_id, name FROM customers WHERE email = 'kaitlynsmith@example.net'; -- Thay email nếu cần
354
355 -- Bước 8: Chạy truy vấn thực tế để kích hoạt Handler counters
```
SELECT * FROM customers WHERE email = 'kaitlynsmith@example.net';
```
Result Grid | Filter Rows: Export: Wrap Cell Content: 

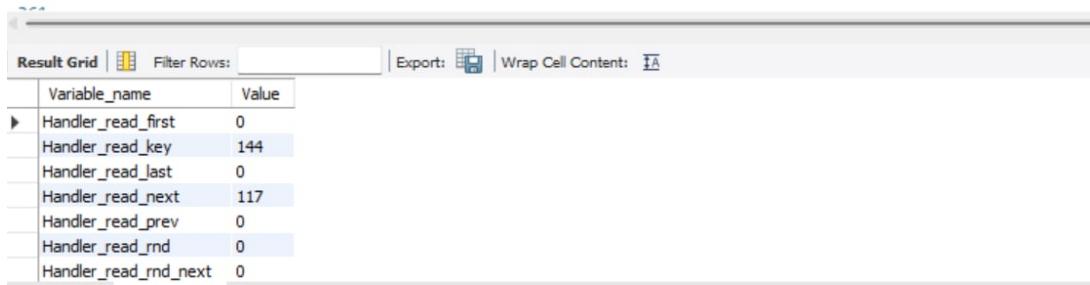

| ID | Select_Type | Table     | Partitions | Type | Possible_Keys       | Key                 | Key_Len | Ref   | Rows | Filtered | Extra |
|----|-------------|-----------|------------|------|---------------------|---------------------|---------|-------|------|----------|-------|
| 1  | SIMPLE      | customers | HULL       | ref  | idx_customers_email | idx_customers_email | 1023    | const | 1    | 100.00   | HULL  |

```

```

Figure 5: EXPLAIN output after indexing

```
359 • SELECT '-- Test 1: Handler Counters SAU khi có index --' AS TC1_HANDLER_COUNTERS_AFTER;
360 • SHOW SESSION STATUS LIKE 'Handler_read%';
```

The screenshot shows the MySQL Workbench interface with a query editor and a results grid. The query editor contains two commands: `SELECT` and `SHOW SESSION STATUS`. The results grid displays the values for various handler counters. The data is as follows:

| Variable_name         | Value |
|-----------------------|-------|
| Handler_read_first    | 0     |
| Handler_read_key      | 144   |
| Handler_read_last     | 0     |
| Handler_read_next     | 117   |
| Handler_read_prev     | 0     |
| Handler_read_rnd      | 0     |
| Handler_read_rnd_next | 0     |

Figure 6: EXPLAIN output after indexing

- **Conclusion:** The optimization successfully shifted the query execution from an inefficient full table scan to a highly targeted index-based access pattern, significantly improving performance.

## 4 Security Configuration

This section outlines the core security mechanisms implemented in our Inventory Management System (IMS), focusing on access control, password storage, and SQL injection prevention.

### 4.1 Access Control & Authorization

The IMS system allows two types of users: **Admin** and **Staff**. Each user logs in using their `email` and `password` credentials. Upon successful login, role-based access control is enforced across the system to restrict sensitive operations and data access.

**Staff Access Activation.** Staff members must first be activated by an admin. Additionally, they are assigned a specific warehouse. They only have access to resources and information related to the assigned warehouse. This ensures compartmentalization of data and limits privilege scope.

**Token-Based Access.** To enforce secure access control:

- We use **JWT (JSON Web Tokens)** as access tokens.
- A **64-character random string** is used as the refresh token.

Access Token contains the following claims:

- `user_id`
- `email`
- `role` (admin or staff)
- `warehouse_id` (only if assigned)

This token must be presented when accessing any protected route. It is verified using a custom middleware function called `login_required`, defined at:

[https://github.com/truongng201/Database-IMS-Project/blob/main/services/shared/template/shared\\_utils/middleware.py](https://github.com/truongng201/Database-IMS-Project/blob/main/services/shared/template/shared_utils/middleware.py)

This middleware performs the following:

- Validates the access token's signature and expiration.
- Extracts role and warehouse information.
- Restricts access based on the user's permissions.
- Checks if the token is blacklisted by consulting the cache system.

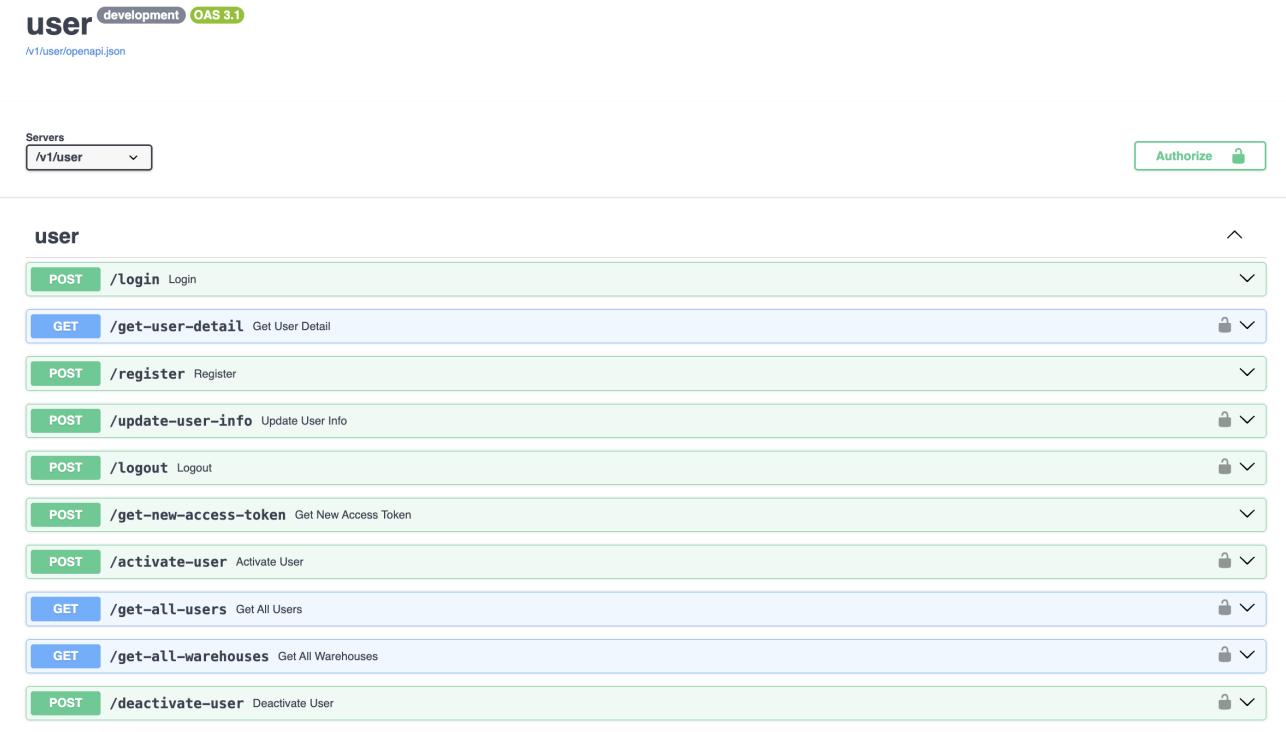

**Logout Mechanism.** A secure logout mechanism is implemented with the following steps:

1. When a user logs out, their refresh token is deleted from the `login_log` table in the database.
2. The corresponding access token is added to a **blacklist stored in the cache system**.
3. This blacklisted access token remains in the cache until it expires (access tokens are valid for 1 hour).
4. The middleware checks if the presented access token is in the blacklist cache. If it exists in the cache, the request is denied, even if the token is otherwise valid.

This logout flow ensures that a user session is securely terminated and prevents reuse of access tokens after logout.

All user authentication and authorization logic (register, login, token handling, logout) is encapsulated in the User Service module:

<https://github.com/truongng201/Database-IMS-Project/tree/main/services/user>

| Method | Path                  | Description          | Auth |
|--------|-----------------------|----------------------|------|
| POST   | /login                | Login                |      |
| GET    | /get-user-detail      | Get User Detail      | 🔒    |
| POST   | /register             | Register             |      |
| POST   | /update-user-info     | Update User Info     | 🔒    |
| POST   | /logout               | Logout               | 🔒    |
| POST   | /get-new-access-token | Get New Access Token |      |
| POST   | /activate-user        | Activate User        | 🔒    |
| GET    | /get-all-users        | Get All Users        | 🔒    |
| GET    | /get-all-warehouses   | Get All Warehouses   | 🔒    |
| POST   | /deactivate-user      | Deactivate User      | 🔒    |

Figure 7: Swagger API documentation for User Service endpoints

## 4.2 Password Storage

To ensure secure storage of user credentials, passwords are **hashed using bcrypt** before being saved into the database.

### Why bcrypt?

- **Salting:** Bcrypt automatically adds a unique salt to each password, which protects against rainbow table attacks.
- **Work Factor:** It includes a configurable cost factor, which allows increasing the computational time required for hashing as hardware improves.
- **Resilience:** It is specifically designed to be slow and thus resistant to brute-force attacks.

**Why not MySQL hash functions?** While MySQL offers built-in hashing functions like `MD5()` or `SHA1()`, these are:

- **Cryptographically Weak:** MD5 and SHA1 are outdated and vulnerable to collision and pre-image attacks.
- **No Salt Support:** These functions do not automatically salt the password, making them highly insecure.
- **Not Adjustable:** They lack tunable work factors to adapt to future hardware.

Hence, password hashing is handled at the application level using bcrypt before storage in the MySQL database.

## 4.3 Preventing SQL Injection

SQL injection is one of the most common and dangerous security vulnerabilities in database-driven applications. To mitigate this risk, the IMS uses **prepared statements with parameterized queries** throughout all database interactions.

**What are prepared statements?** Prepared statements separate the SQL code from the data input by the user. Placeholders are used in the SQL query, and actual values are passed separately. This eliminates the risk of malicious SQL code being injected into queries.

### Advantages:

- **Protection:** Prevents malicious user input from altering the SQL command structure.
- **Reusability:** Compiles the SQL statement once and reuses it with different inputs.
- **Performance:** Boosts performance on frequently executed queries.

```
def get_all_product_by_user(self, user_id, params=(100, 0), search=None):
 # First get the user's warehouse_id
 user_query = """
 SELECT warehouse_id FROM users WHERE user_id = %s
 """
 user_result = self.db.execute_query(user_query, (user_id,))
 if not user_result:
 return []

 warehouse_id = user_result[0][0]

 where_conditions = ["warehouse_id = %s"]
 query_params = [warehouse_id]

 # Build search conditions - search across name, category, and supplier
 if search:
 where_conditions.append("(name LIKE %s OR category_name LIKE %s OR supplier_name LIKE %s)")
 search_term = f"%{search}%"
 query_params.extend([search_term, search_term, search_term])

 # Build query
 query = "SELECT * FROM product_summary WHERE " + " AND ".join(where_conditions)
 query += " LIMIT %s OFFSET %s"
```

Figure 8: Example of using prepared statements in Python (MySQL connector)

**Example:** This approach is used across all services in the project to maintain consistency and safeguard against injection vulnerabilities.

## 5 End-to-end Testing & Web Integration

Note: All core CRUD functionalities have been fully implemented. However, due to the project's large scope and limited time constraints, a few features are currently either completed on the API side or on the client side, but not yet fully integrated between the two. Integration for these remaining parts is planned for future updates.

To validate the core functionalities of the Inventory Management System (IMS), we conducted comprehensive end-to-end testing that simulates realistic workflows across different user roles and services. This section documents the testing process and outcomes.

### 5.1 Sample Data

For testing purposes, we generated a set of realistic sample data using a custom Python script available at:

[https://github.com/truongng201/Database-IMS-Project/blob/main/scripts/generate\\_fake\\_data.py](https://github.com/truongng201/Database-IMS-Project/blob/main/scripts/generate_fake_data.py)

The generated data includes:

- **NUM\_SUPPLIERS = 100**
- **NUM\_WAREHOUSES = 5**
- **NUM\_PRODUCTS = 1000**
- **NUM\_CUSTOMERS = 100**
- **NUM\_ORDERS = 1000**
- **NUM\_ORDER\_ITEMS = 1000**

*Note: Both dashboards share the same layout, but content is filtered based on the assigned warehouse.*

### 5.2.6 Logout

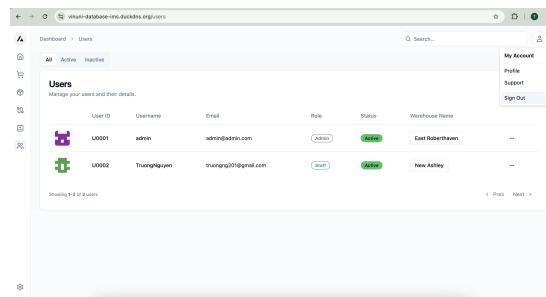

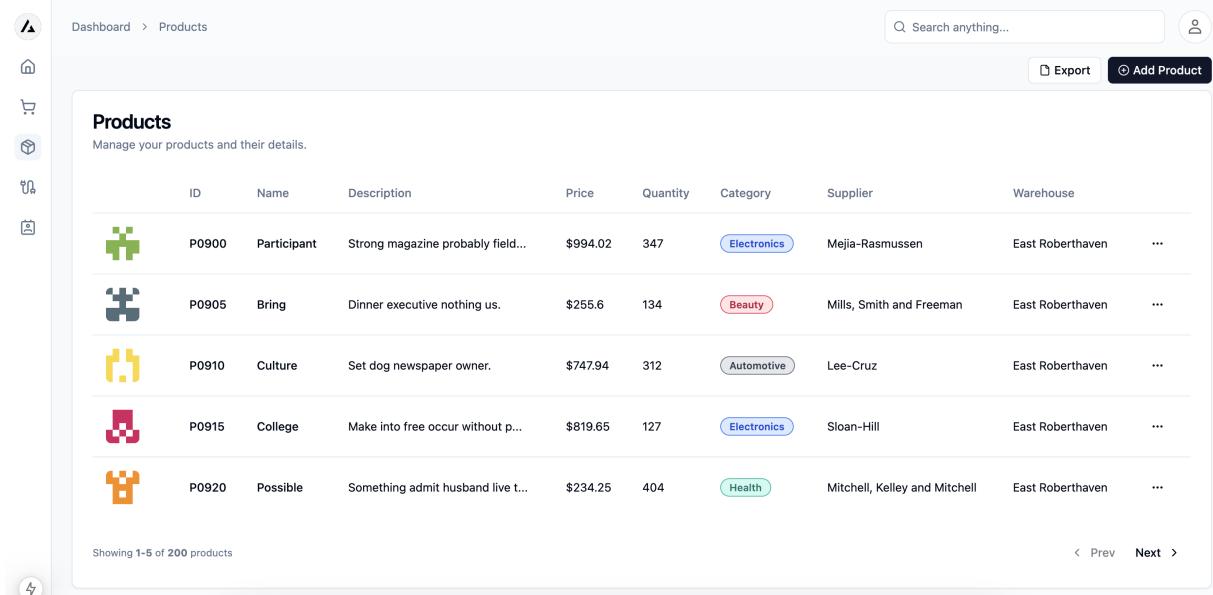

Figure 17: Logout button on dashboard

## 5.3 Product View

### 5.3.1 For Staff

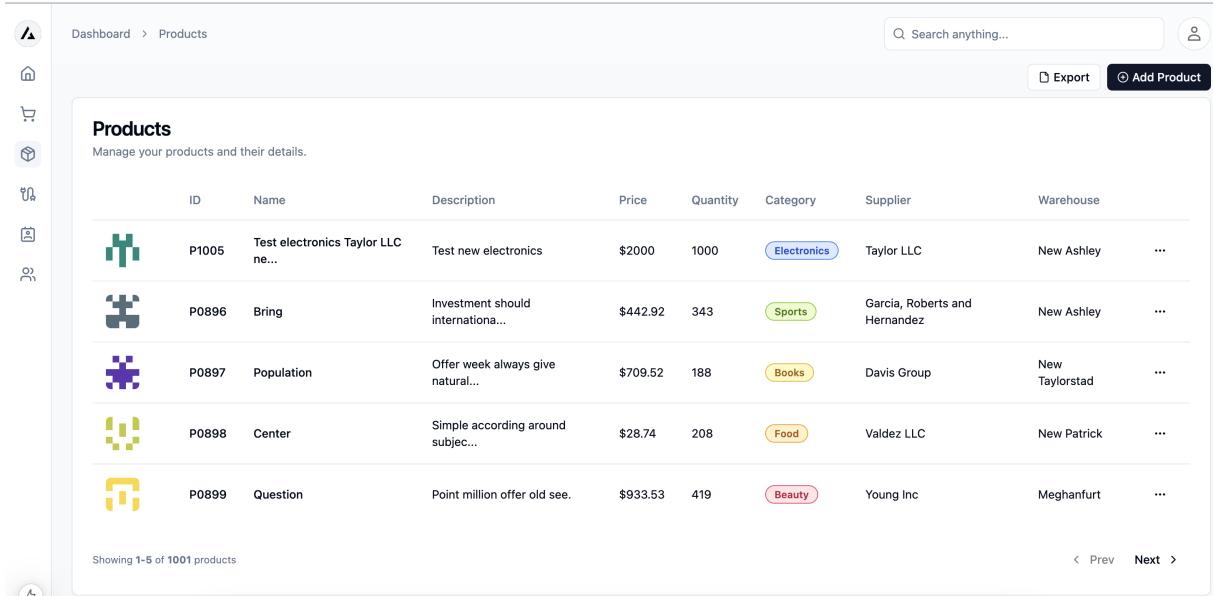

The screenshot shows a product management interface for staff. On the left is a sidebar with icons for Dashboard, Home, Products, Reports, and Help. The main area has a header with 'Dashboard > Products', a search bar, and buttons for 'Export' and 'Add Product'. A sub-header 'Products' with the sub-instruction 'Manage your products and their details.' is followed by a table. The table columns are ID, Name, Description, Price, Quantity, Category, Supplier, and Warehouse. Five products are listed:

| ID    | Name        | Description                       | Price    | Quantity | Category    | Supplier                      | Warehouse        |

At the bottom, it says 'Showing 1-5 of 1001 products' with navigation arrows for 'Prev' and 'Next'.

Figure 19: Product view for admin showing all products

### 5.3.3 Add Product

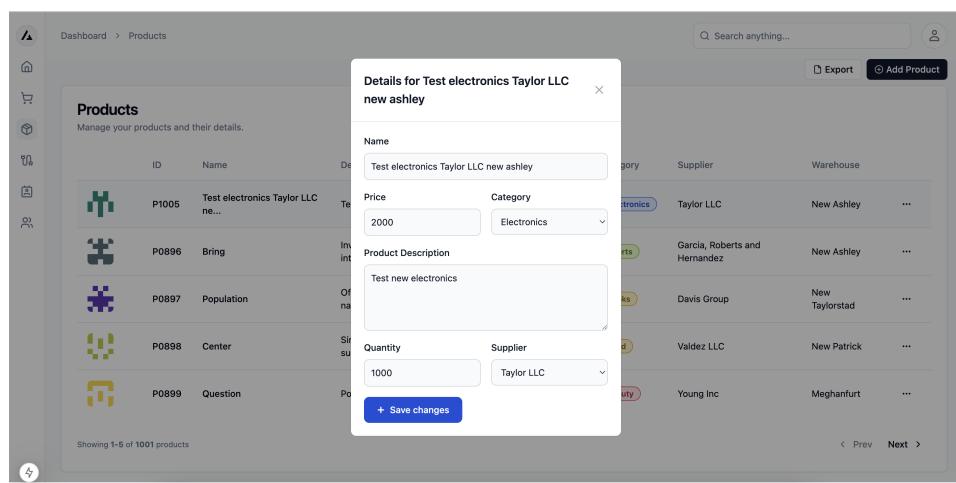

The screenshot shows a modal window titled "Add New Product" over a list of products. The product details being added are:

- Name: Test electronics Taylor LLC
- Price: \$2999
- Category: Select category
- Product Description: Write product description here
- Quantity: 100
- Supplier: Select supplier
- Warehouse: Select warehouse

Figure 20: Add product form

### 5.3.4 Edit Product

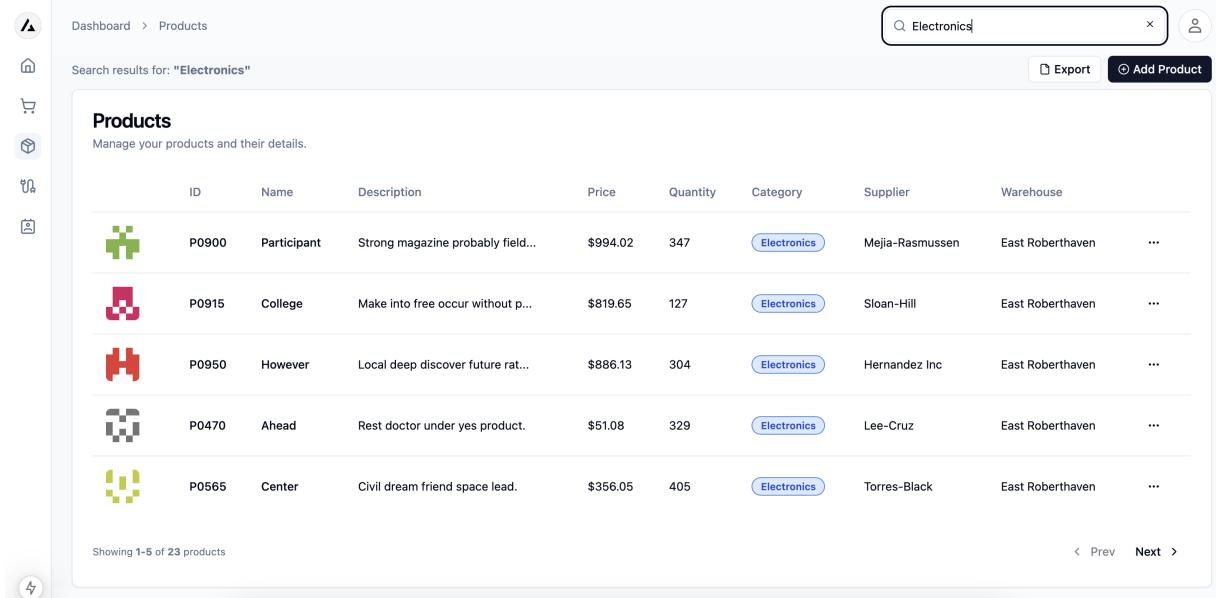

The screenshot shows a modal window titled "Details for Test electronics Taylor LLC new ashley" over a list of products. The product details being edited are:

- Name: Test electronics Taylor LLC new ashley
- Price: 2000
- Category: Electronics
- Product Description: Test new electronics
- Quantity: 1000
- Supplier: Taylor LLC

Figure 21: Edit product form

### 5.3.5 Super Search

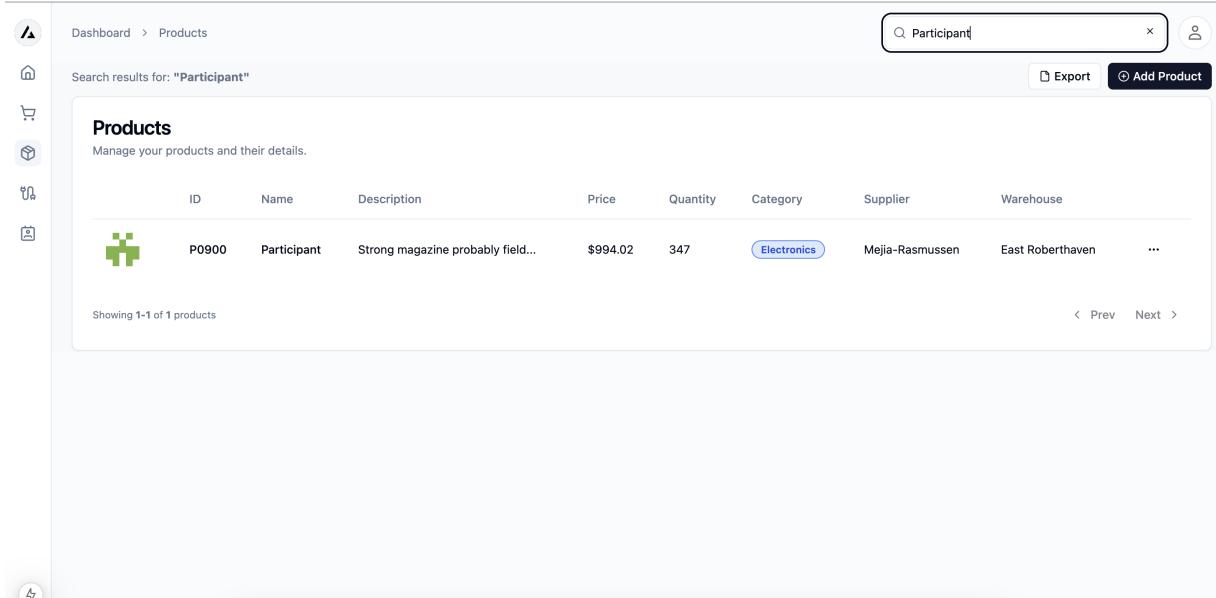

The screenshot shows a web-based application interface for managing products. On the left is a vertical sidebar with icons for Home, Products, Categories, and Reports. The main area has a header with 'Dashboard > Products' and a search bar containing 'Electronics'. Below the header, it says 'Search results for: "Electronics"' and there are 'Export' and 'Add Product' buttons. A large table titled 'Products' lists items with columns for ID, Name, Description, Price, Quantity, Category, Supplier, and Warehouse. The first five rows are shown:

| ID    | Name        | Description                       | Price    | Quantity | Category    | Supplier        | Warehouse        |
|-------|-------------|-----------------------------------|----------|----------|-------------|-----------------|------------------|
| P0900 | Participant | Strong magazine probably field... | \$994.02 | 347      | Electronics | Mejia-Rasmussen | East Roberthaven |
| P0915 | College     | Make into free occur without p... | \$819.65 | 127      | Electronics | Sloan-Hill      | East Roberthaven |
| P0950 | However     | Local deep discover future rat... | \$886.13 | 304      | Electronics | Hernandez Inc   | East Roberthaven |
| P0470 | Ahead       | Rest doctor under yes product.    | \$51.08  | 329      | Electronics | Lee-Cruz        | East Roberthaven |

At the bottom, it says 'Showing 1-5 of 23 products' with navigation arrows for 'Prev' and 'Next'.

Figure 22: Super search - filtering by keyword 1

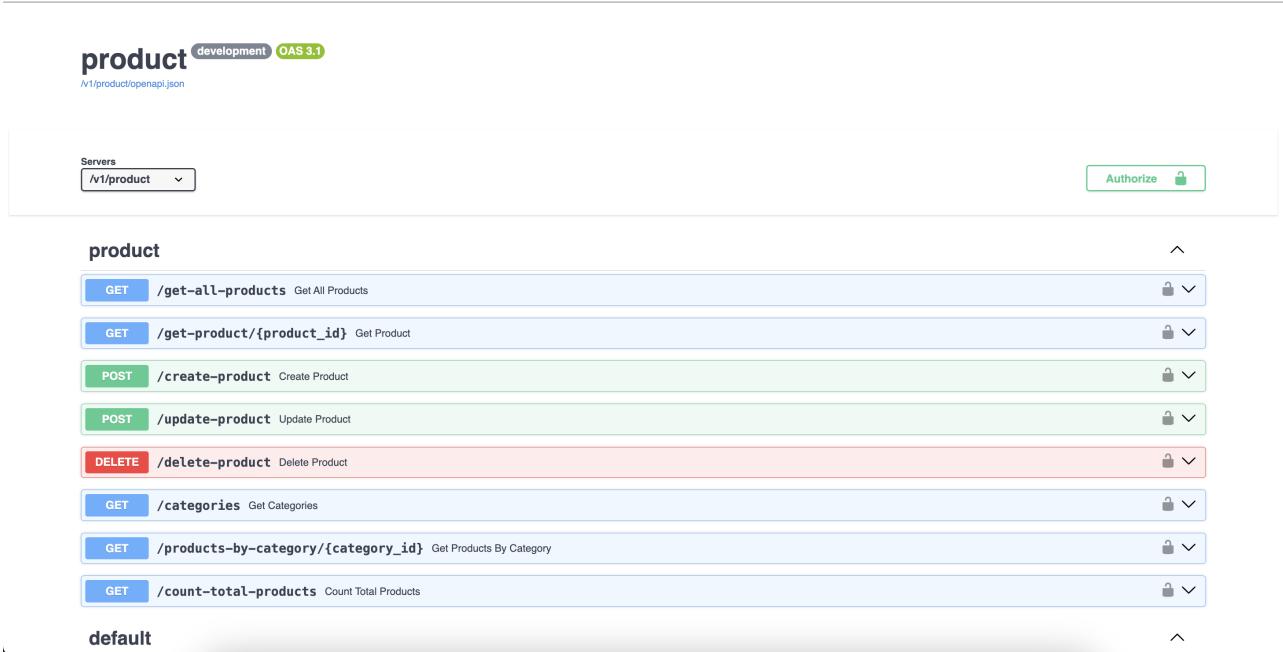

This screenshot shows the same application interface as Figure 22, but the search term in the search bar is now 'Participant'. The search results table shows only one item:

| ID    | Name        | Description                       | Price    | Quantity | Category    | Supplier        | Warehouse        |
|-------|-------------|-----------------------------------|----------|----------|-------------|-----------------|------------------|
| P0900 | Participant | Strong magazine probably field... | \$994.02 | 347      | Electronics | Mejia-Rasmussen | East Roberthaven |

At the bottom, it says 'Showing 1-1 of 1 products' with navigation arrows for 'Prev' and 'Next'.

Figure 23: Super search - filtering by keyword 2

### 5.3.6 Product Endpoint

The screenshot shows the Swagger UI for the product API. At the top, there's a header with the title "product", a "development" button, and an "OAS 3.1" badge. Below the header, there's a "Servers" dropdown set to "/v1/product" and an "Authorize" button with a lock icon.

The main content area is titled "product" and contains a list of API endpoints:

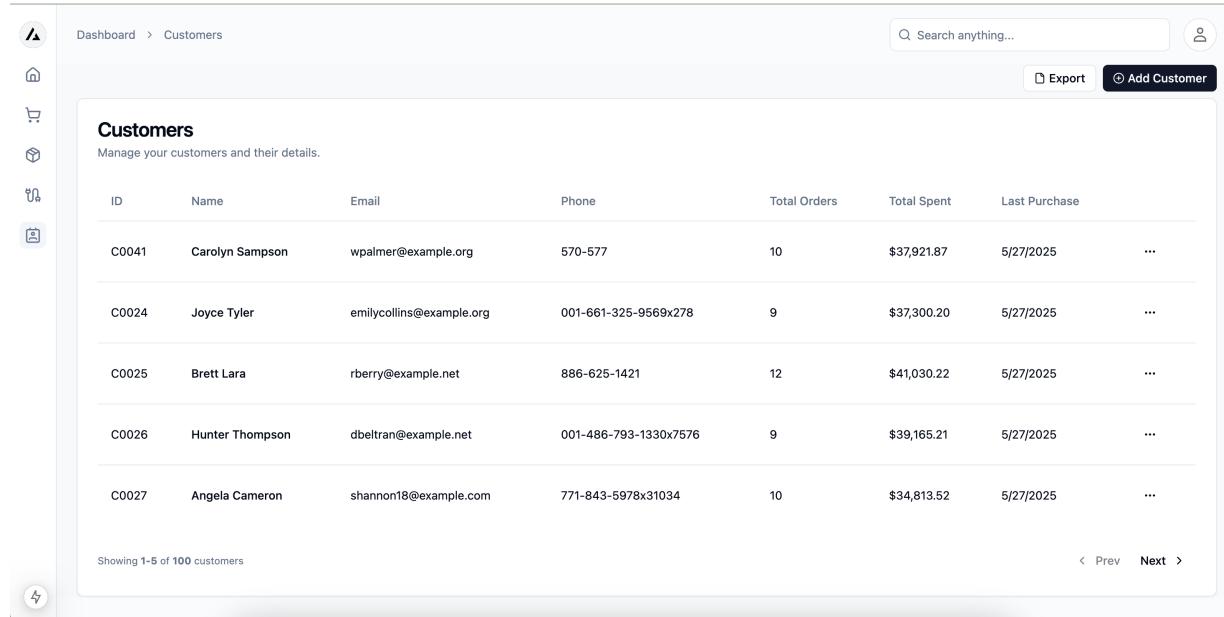

- GET /get-all-products** Get All Products
- GET /get-product/{product\_id}** Get Product
- POST /create-product** Create Product
- POST /update-product** Update Product
- DELETE /delete-product** Delete Product
- GET /categories** Get Categories
- GET /products-by-category/{category\_id}** Get Products By Category
- GET /count-total-products** Count Total Products

Below the "product" section, there's a collapsed section titled "default".

Figure 24: Swagger documentation for product API endpoints

## 5.4 Customer View

### 5.4.1 For Staff/Admin

The screenshot shows a customer list view in a web application. On the left, there's a sidebar with icons for Home, Customers, Categories, and Reports. The main area has a breadcrumb navigation: Dashboard > Customers. It includes a search bar, an "Export" button, and an "Add Customer" button.

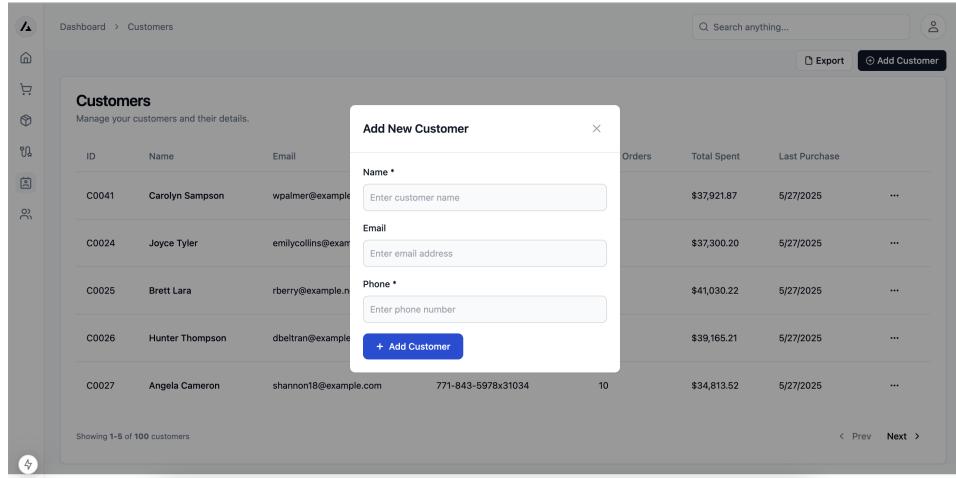

The main content area is titled "Customers" and contains a sub-instruction: "Manage your customers and their details." A table lists 7 customers:

| ID    | Name            | Email                    | Phone                 | Total Orders | Total Spent | Last Purchase |
|-------|-----------------|--------------------------|-----------------------|--------------|-------------|---------------|
| C0041 | Carolyn Sampson | wpalmer@example.org      | 570-577               | 10           | \$37,921.87 | 5/27/2025     |
| C0024 | Joyce Tyler     | emilycollins@example.org | 001-661-325-9569x278  | 9            | \$37,300.20 | 5/27/2025     |
| C0025 | Brett Lara      | rberry@example.net       | 886-625-1421          | 12           | \$41,030.22 | 5/27/2025     |
| C0026 | Hunter Thompson | dbeltran@example.net     | 001-486-793-1330x7576 | 9            | \$39,165.21 | 5/27/2025     |
| C0027 | Angela Cameron  | shannon18@example.com    | 771-843-5978x31034    | 10           | \$34,813.52 | 5/27/2025     |

At the bottom, it says "Showing 1-5 of 100 customers" and has "Prev" and "Next" buttons.

Figure 25: Customer list view

### 5.4.2 Add Customer

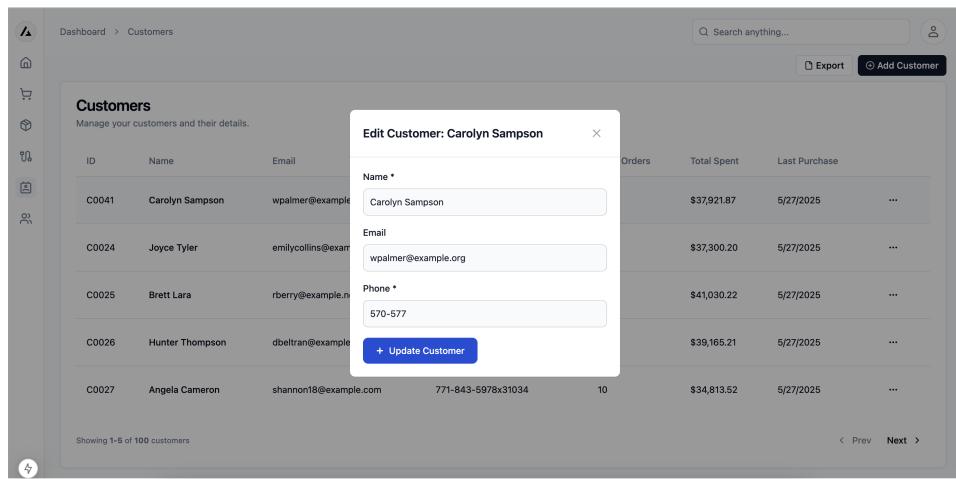

The screenshot shows a modal window titled "Add New Customer" overlaid on a customer list. The modal contains fields for Name\*, Email, and Phone\*. A blue "+ Add Customer" button is at the bottom right of the modal. The background table lists 10 customers with columns for ID, Name, Email, Orders, Total Spent, and Last Purchase.

| ID    | Name            | Email                    | Orders             | Total Spent | Last Purchase |
|-------|-----------------|--------------------------|--------------------|-------------|---------------|
| C0041 | Carolyn Sampson | wpalmer@example.com      |                    | \$37,921.87 | 5/27/2025     |
| C0024 | Joyce Tyler     | emilycollins@example.org |                    | \$37,300.20 | 5/27/2025     |
| C0025 | Brett Lara      | rberry@example.net       |                    | \$41,030.22 | 5/27/2025     |
| C0026 | Hunter Thompson | dbeltran@example.com     |                    | \$39,165.21 | 5/27/2025     |
| C0027 | Angela Cameron  | shannon18@example.com    | 771-843-5978x31034 | \$34,813.52 | 5/27/2025     |

Figure 26: Add customer form

### 5.4.3 Edit Customer

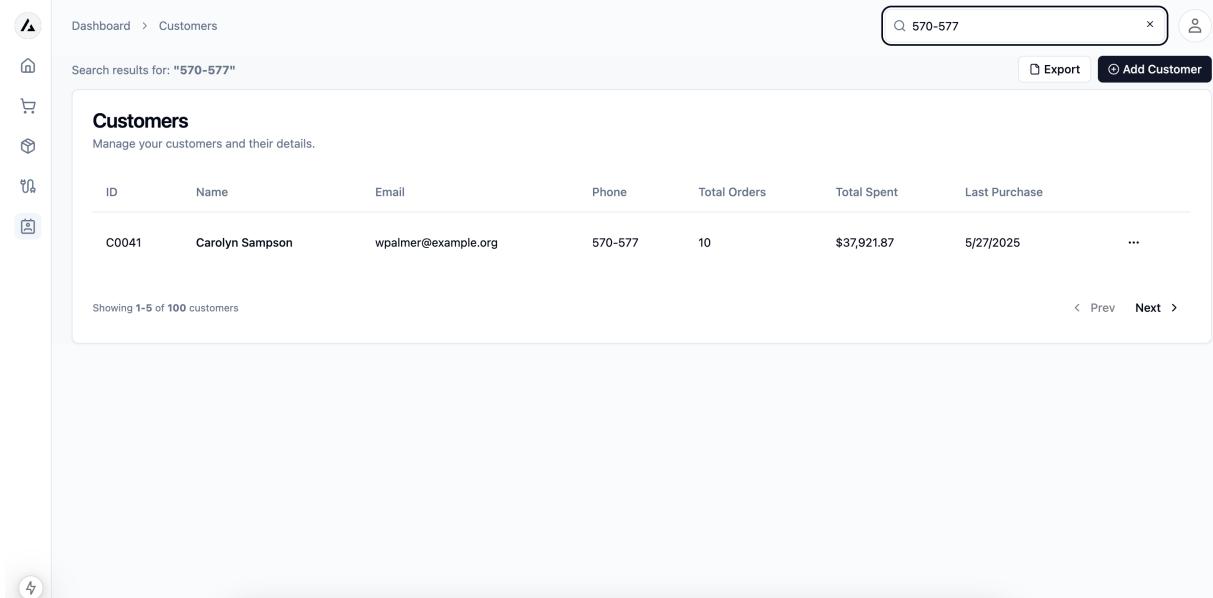

The screenshot shows an edit modal window for Carolyn Sampson. The modal contains fields for Name\* (Carolyn Sampson), Email (wpalmer@example.org), and Phone\* (570-577). A blue "+ Update Customer" button is at the bottom right of the modal. The background table lists 10 customers with columns for ID, Name, Email, Orders, Total Spent, and Last Purchase.

| ID    | Name            | Email                    | Orders             | Total Spent | Last Purchase |
|-------|-----------------|--------------------------|--------------------|-------------|---------------|
| C0041 | Carolyn Sampson | wpalmer@example.com      |                    | \$37,921.87 | 5/27/2025     |
| C0024 | Joyce Tyler     | emilycollins@example.org |                    | \$37,300.20 | 5/27/2025     |
| C0025 | Brett Lara      | rberry@example.net       |                    | \$41,030.22 | 5/27/2025     |
| C0026 | Hunter Thompson | dbeltran@example.com     |                    | \$39,165.21 | 5/27/2025     |
| C0027 | Angela Cameron  | shannon18@example.com    | 771-843-5978x31034 | \$34,813.52 | 5/27/2025     |

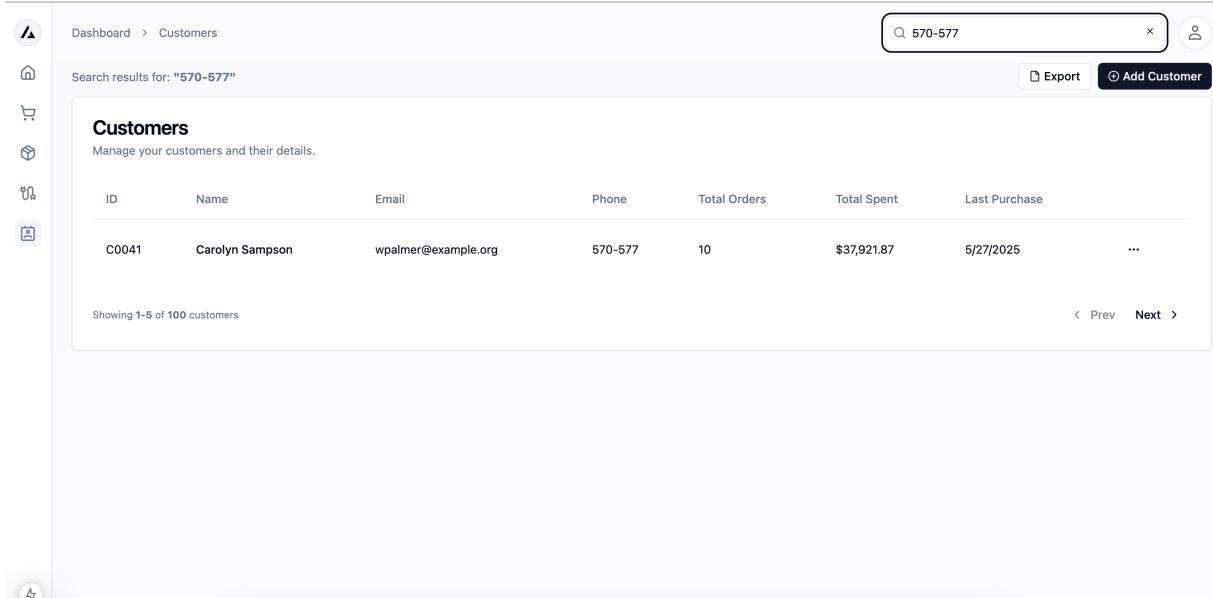

Figure 27: Edit customer form

#### 5.4.4 Super Search

The screenshot shows a web application interface for managing customers. On the left is a vertical sidebar with icons for Home, Customers, Orders, Products, and Reports. The main header bar includes a back button, a search bar containing '570-577', and buttons for 'Export' and 'Add Customer'. The title 'Customers' is displayed above a table. The table has columns for ID, Name, Email, Phone, Total Orders, Total Spent, and Last Purchase. A single row is shown for 'C0041 Carolyn Sampson'. At the bottom of the table, it says 'Showing 1-5 of 100 customers'.

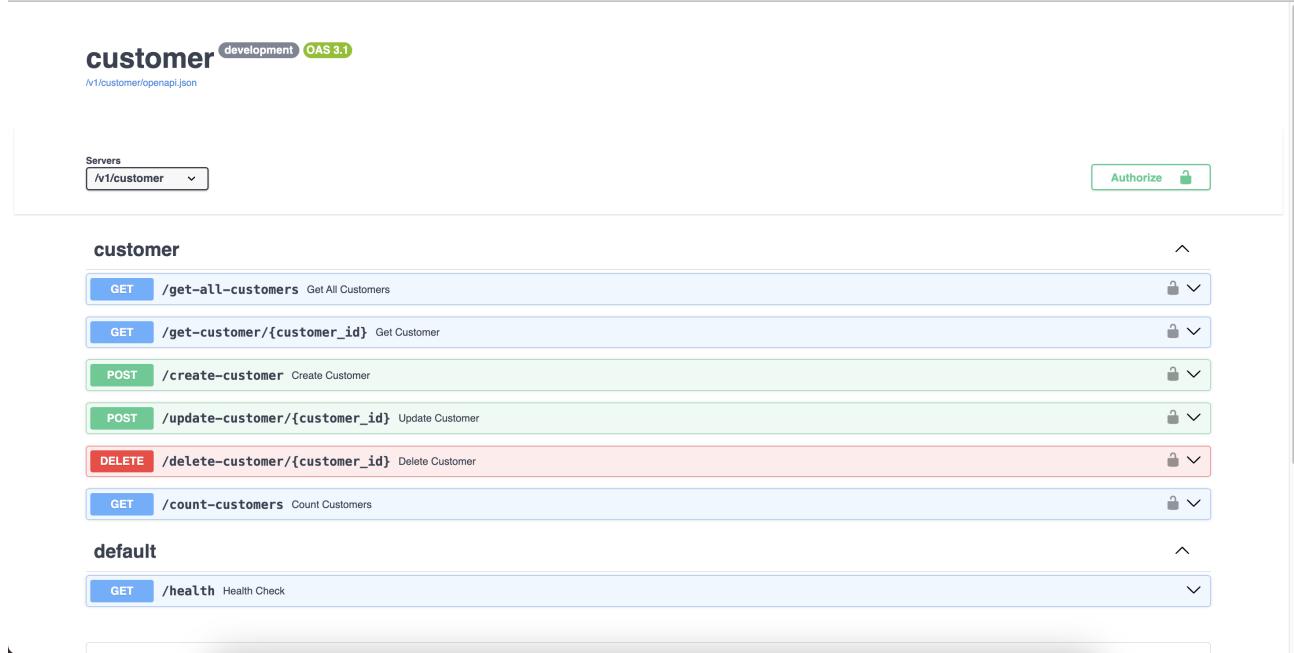

Figure 28: Super search - filtering by keyword 1

This screenshot is identical to Figure 28, showing the same search results for the keyword '570-577'. The customer 'Carolyn Sampson' is listed with the same details: ID C0041, Name Carolyn Sampson, Email wpalmer@example.org, Phone 570-577, Total Orders 10, Total Spent \$37,921.87, and Last Purchase 5/27/2025.

Figure 29: Super search - filtering by keyword 2

### 5.4.5 Customer Docs

The screenshot shows the API documentation for the 'customer' endpoint. It includes a navigation bar with 'Servers' set to '/v1/customer' and an 'Authorize' button. The main content area is titled 'customer' and lists the following endpoints:

- GET /get-all-customers** Get All Customers
- GET /get-customer/{customer\_id}** Get Customer
- POST /create-customer** Create Customer
- POST /update-customer/{customer\_id}** Update Customer
- DELETE /delete-customer/{customer\_id}** Delete Customer
- GET /count-customers** Count Customers

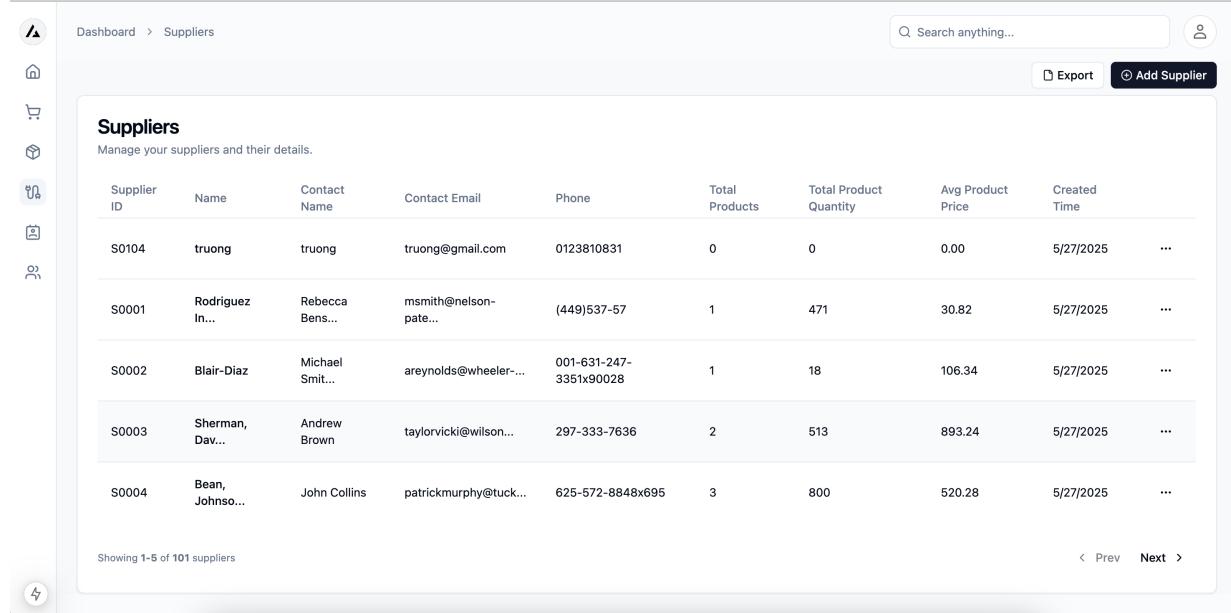

Below this, there is a section for 'default' with one endpoint:

- GET /health** Health Check

Figure 30: Customer API endpoint documentation

### 5.5 Supplier View

#### 5.5.1 For Staff/Admin

The screenshot shows the 'Suppliers' view. On the left is a sidebar with icons for Home, Suppliers, Products, and Customers. The main area has a breadcrumb 'Dashboard > Suppliers' and a search bar. At the top right are 'Export' and 'Add Supplier' buttons. The central part is titled 'Suppliers' with the sub-instruction 'Manage your suppliers and their details.' Below is a table with the following data:

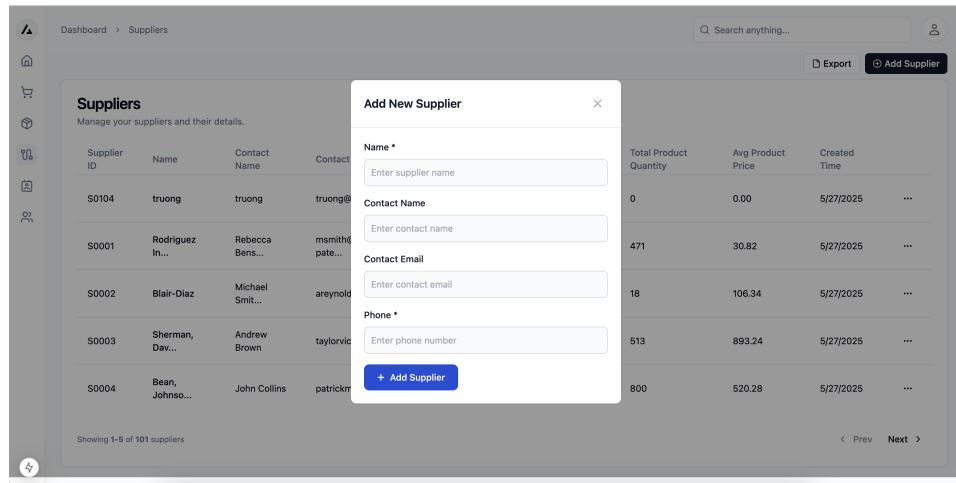

| Supplier ID | Name            | Contact Name    | Contact Email         | Phone                  | Total Products | Total Product Quantity | Avg Product Price | Created Time | ... |

Showing 1-5 of 101 suppliers

Figure 35: Super search - filtering by keyword 2

### 5.5.5 Supplier Docs

The screenshot shows the API documentation for the 'supplier' endpoint. It includes sections for 'supplier' and 'default'. The 'supplier' section lists the following endpoints:

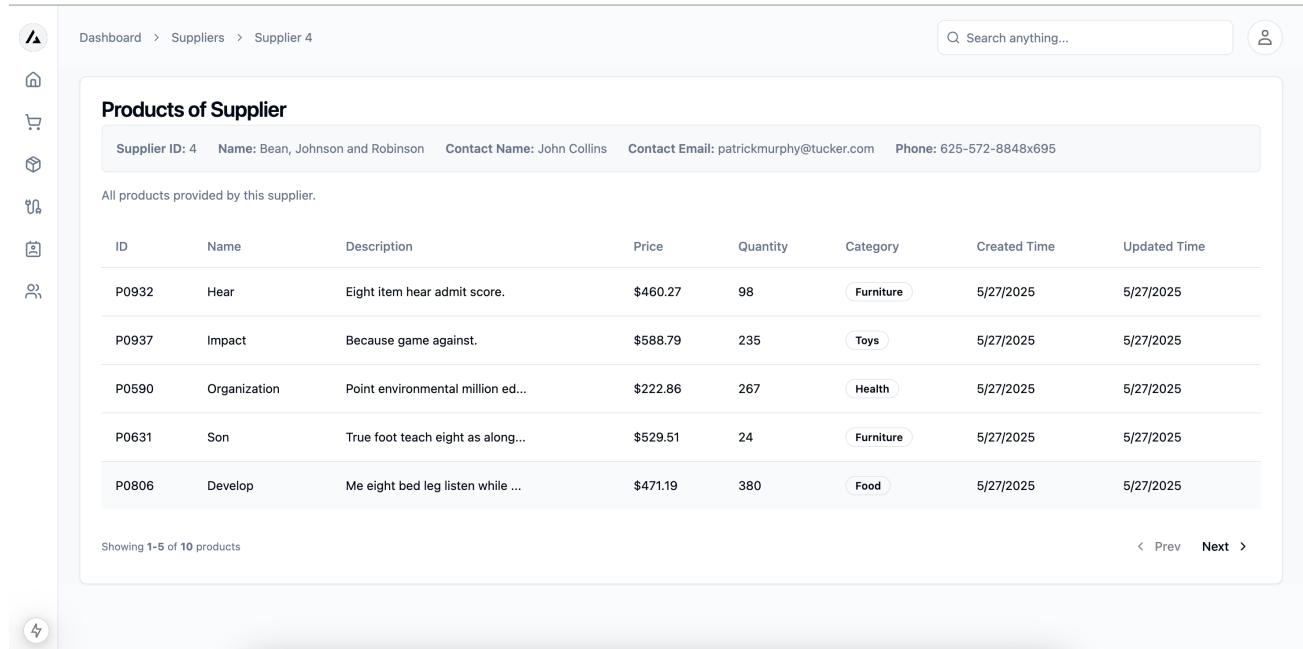

- GET /get-all-suppliers Get All Suppliers
- GET /get-supplier/{supplier\_id} Get Supplier
- POST /create-supplier Create Supplier
- POST /update-supplier/{supplier\_id} Update Supplier
- DELETE /delete-supplier/{supplier\_id} Delete Supplier
- GET /count-suppliers Count Suppliers

The 'default' section lists:

- GET /health Health Check

Figure 36: Supplier API endpoint documentation

### 5.5.6 Supplier Detail with Product

The screenshot shows the 'Products of Supplier' section for Supplier ID 4. The supplier details are:

- Supplier ID: 4
- Name: Bean, Johnson and Robinson
- Contact Name: John Collins
- Contact Email: patrickmurphy@tucker.com
- Phone: 625-572-8848x695

All products provided by this supplier:

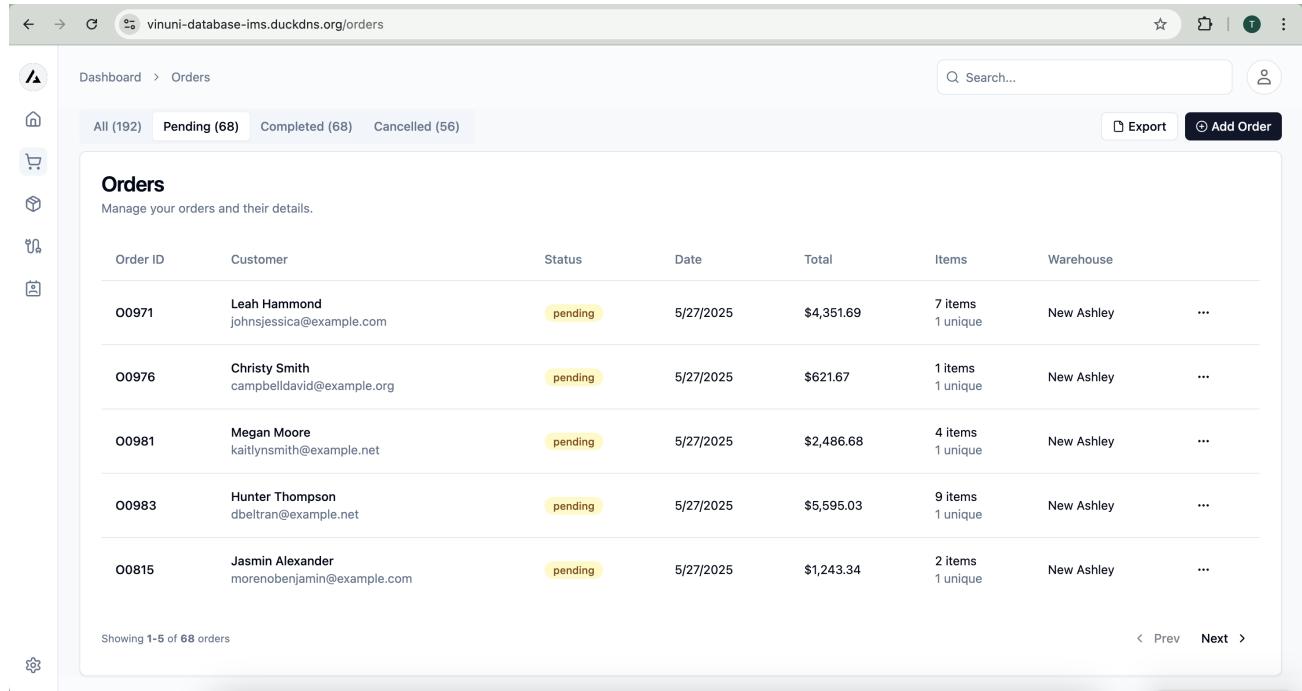

| ID    | Name         | Description                       | Price    | Quantity | Category  | Created Time | Updated Time |

Figure 40: Cancelled orders

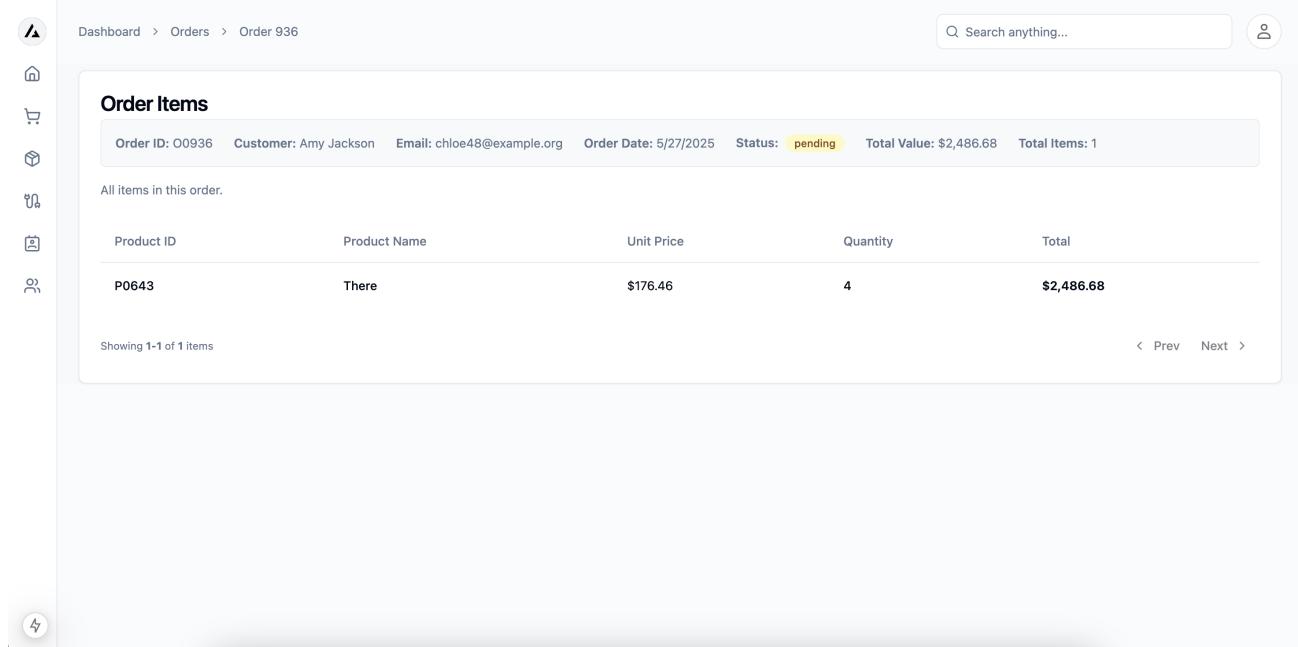

This screenshot shows the 'All' orders page from a web application. The page title is 'Orders' and it displays 192 orders. The interface is identical to Figure 40, showing columns for Order ID, Customer, Status, Date, Total, Items, and Warehouse. The status column uses color-coded circles to indicate the order's current status: green for completed, red for cancelled, and yellow for pending.

| Order ID | Customer                                   | Status    | Date      | Total      | Items               | Warehouse  |
|----------|--------------------------------------------|-----------|-----------|------------|---------------------|------------|
| O0966    | Caitlin Bennett<br>erintapia@example.com   | completed | 5/27/2025 | \$1,865.01 | 3 items<br>1 unique | New Ashley |
| O0968    | Caitlin Bennett<br>erintapia@example.com   | cancelled | 5/27/2025 | \$1,243.34 | 2 items<br>1 unique | New Ashley |
| O0971    | Leah Hammond<br>johnsjessica@example.com   | pending   | 5/27/2025 | \$4,351.69 | 7 items<br>1 unique | New Ashley |
| O0976    | Christy Smith<br>campbelldavid@example.org | pending   | 5/27/2025 | \$621.67   | 1 items<br>1 unique | New Ashley |
| O0979    | Juan Bowman<br>jcarter@example.org         | cancelled | 5/27/2025 | \$4,973.36 | 8 items<br>1 unique | New Ashley |

### 5.6.2 Order detail with order item

The screenshot shows a web-based application interface for managing orders. On the left, there is a vertical sidebar with icons for Dashboard, Home, Cart, and User profile. The main content area has a header "Order Items" and displays the following information:

Order ID: O0936 Customer: Amy Jackson Email: chloe48@example.org Order Date: 5/27/2025 Status: pending Total Value: \$2,486.68 Total Items: 1

All items in this order:

| Product ID | Product Name | Unit Price | Quantity | Total      |
|------------|--------------|------------|----------|------------|
| P0643      | There        | \$176.46   | 4        | \$2,486.68 |

Showing 1-1 of 1 items

At the bottom right, there are navigation links: < Prev, Next >.
